

OrchidApp

Configure saving backups to a cloud folder

User guide for protecting your OrchidApp backups against total computer failure

The OrchidApp Launcher includes a Configure cloud backup button.

Purpose

Use this guide after OrchidApp has been installed and started. It explains how to choose a cloud-synced folder where OrchidApp will copy the latest backup after each successful local backup.

This is the safest everyday recovery option because the backup is stored away from the computer running OrchidApp. If the computer is lost, damaged or replaced, the backup can be downloaded again from the cloud provider and restored on a new machine.

Important

A cloud backup is only useful after the cloud provider has finished syncing the backup file. After configuring the folder, check that OneDrive, Google Drive, iCloud Drive or your chosen provider shows the backup as synced.

Before you start

- Install OrchidApp and create the desktop or Start menu shortcut first.
- Ensure you are signed into your cloud provider on the computer.
- Create or choose a folder that is synced to the cloud, such as OneDrive, Google Drive, iCloud Drive or another trusted provider. Use a clear folder name, such as OrchidBackups.
- Do not choose a temporary folder or a folder that is not included in cloud sync.

How OrchidApp cloud backup works

OrchidApp keeps its normal local backups. When a cloud backup folder is configured, OrchidApp also copies the latest successful backup to the selected cloud folder.

Note: When you start OrchidApp it automatically checks when the last backup was made. If it was more than 7 days ago it creates a backup automatically without interrupting your use of the app.

The cloud copy is intended for disaster recovery. It gives you a recent backup that should still be available even if the original computer fails completely.

Quick checklist

- Close the OrchidApp browser tab if it is covering the launcher window.
- Open or bring forward the OrchidApp Launcher window.
- Select Configure cloud backup.
- Choose a folder that is synced by your cloud provider.
- Confirm that OrchidApp saves the cloud backup folder.
- Run Back up now or wait for the next automatic backup.
- Check that the cloud provider has synced the backup file.

Step-by-step setup

1. Close the browser tab if required

If OrchidApp is open in your browser and the launcher is hidden behind it, close the browser tab or switch back to the launcher window. Closing only the browser tab does not stop OrchidApp.

Close the browser tab if you need to see the OrchidApp Launcher.

2. Bring the OrchidApp Launcher to the front

Select the OrchidApp icon on the taskbar to bring the launcher window to the front. The launcher window must remain open while using OrchidApp.

Select the OrchidApp icon on the taskbar to return to the launcher.

3. Choose Configure cloud backup

In the OrchidApp Launcher, select Configure cloud backup. This opens a folder picker so you can choose where the latest cloud backup should be copied.

Select Configure cloud backup from the OrchidApp Launcher.

4. Select a cloud-synced folder

Choose a folder that your cloud provider already syncs. In this example the folder is called OrchidBackups and is inside OneDrive.

You can use an existing folder or create a new one. The important point is that the folder must be included in cloud sync.

Choose a folder synced by OneDrive, Google Drive, iCloud Drive or another provider.

5. Confirm the folder

Select the folder, then choose Select Folder. OrchidApp saves the selected folder as the cloud backup location.

OrchidApp confirms when the cloud backup folder has been saved.

6. Check the backup log

After the folder is saved, the launcher log should show that the cloud backup folder has been configured. When a backup completes, OrchidApp creates the local backup first, then copies the latest backup to the configured cloud folder.

If the log says the cloud backup folder is not configured, repeat the steps above and select the cloud-synced folder again.

Choosing a good cloud backup folder

Good choice	Avoid
OneDrive\Documents\OrchidBackups	Downloads
Google Drive\OrchidBackups	Desktop, unless it is definitely synced
iCloud Drive\OrchidBackups	Temporary folders
A clearly named cloud-synced backup folder	External drives that are often unplugged

How to check the backup is protected

- Open the cloud folder in File Explorer and check that OrchidAppDataBackup.zip or an OrchidApp backup ZIP is present.
- Check the cloud sync status icon. It should show that the file is synced or available in the cloud.
- Open your cloud provider on another device or in a web browser and confirm that the backup file is visible there.
- Do not manually edit the backup ZIP file.

Troubleshooting

Problem	What to do
I cannot see the OrchidApp Launcher	Select the OrchidApp icon on the taskbar or close the browser tab to reveal the launcher.
The log says the cloud backup folder is not configured	Select Configure cloud backup again and choose a cloud-synced folder.
The backup file is in the folder but not in the cloud	Wait for your cloud provider to sync. Check that you are signed in and that syncing is not paused.
I moved or renamed the cloud folder	Open OrchidApp Launcher and configure the cloud backup folder again.
The cloud copy fails but local backup succeeds	Your local backup still exists. Fix the cloud folder or sync problem, then run Back up now again.

Cloud backup checklist

- The OrchidApp Launcher shows the cloud backup folder has been configured.
- A backup has completed successfully.
- The backup ZIP exists in the selected cloud folder.
- The cloud provider shows the file as synced.
- You know where to find the cloud backup if the computer fails.

Keep this simple

The best backup is one that runs automatically and is easy to find later. Use one obvious cloud-synced folder and let OrchidApp keep the latest cloud copy there.
